

Project

St Mary's Church

Architect

Lee Evans Partnership
Dry flooring system
 Jupiter Heating
 Systems

Location Broadwater,
 Worthing, West Sussex
Completed
 July 2009

By Amanda Birch

One of the concerns Lee Evans Partnership had when commissioned to install underfloor heating into a medieval church was how they would do it without introducing wet trades.

"The grade I listed church had been dry for many years," says project architect John Minter. "So we were reluctant to bring in wet trades that would introduce huge amounts of moisture into the building."

The solution came in the form of a German-developed, dry-installed underfloor heating system by Jupiter Heating Systems.

Another attraction of the product was its rapid installation time – it took only 12 days to install 180sq m of flooring, as opposed to the months it takes to install some screed heating systems.

Part of the brief was for the church to be ready for the summer wedding season. This gave the architects a limited window to

Floor construction details

- 1 Single coat of lime plaster
- 2 Newton 520 membrane
- 3 Lime concrete border
- 4 Visqueen 1200 gauge DPM
- 5 10mm Fernacel permanent shuttering against limecrete
- 6 20mm Fernacel with half lapped, screwed and glued joints
- 7 70mm x 335mm Perndock galv. steel floor duct with 12mm plywood cover
- 8 75mm x 50mm hardwood
- 9 9mm WBP plywood packing
- 10 Edge of Emperor stone lines
- 11 100mm x 20mm limestone Emperor by Keystone with grout
- 12 400mm x random x 20mm limestone Sierra by Keystone with grout
- 13 Two-layer adhesive
- 14 Jupiter separating membrane
- 15 Jupiter 20mm terracotta T&G SRT tiles
- 16 30mm Jupiter EPS with aluminium diffusion plate and UF heating pipes
- 17 50mm Kingspan Styrozone H500 Insulation
- 18 18 Mfn 30mm Jupiter crushed slate levelling material.

implement the flooring works as well as other refurbishment works.

The flooring had to accommodate various sub-floor levels and provide a load-bearing surface suitable for large format limestone tiles. It also had to incorporate a heating loop plus other cabling, together with the underfloor heating system.

The Jupiter System met all of these requirements, and Minter says that, six months on, the lime-stone-finished floor is wearing well with no cracking. The architects have been so impressed they have specified the system for two other church projects currently on site.

Eliminating the use of screed is the key innovation of the Jupiter product. The replacement material is a 20mm-thick terracotta tile called the Screed Replacement Tile. The 400mm x 180mm tongue and groove tiles are glued together and, after 24 hours, provide a very strong, ready-to-use floor in which the heating can

EPS Edge Zone panels were covered with a protective membrane (above), over which the heating system and Screed Replacement Tiles were laid. The final floor finish (right).

immediately be switched on.

Before the tiles can be laid, it is essential the existing floor is level. At St Mary's Church the original medieval floor was far lower than the final floor finish, and so needed to be filled. Most of the void was filled using Foamglass recycled aggregate to a depth of about 600mm, supplied by Ty-Mawr

Lime. In St Mary's Church, a damp-proof membrane was laid over the foamglass aggregate followed by a layer of crushed slate – a requirement for making the floor even. Then a 20mm-thick layer of Permacell was laid, which provided a good load-bearing surface for the layer of high compressive-strength insulation that followed.

elements, also 30mm thick, instead of EPS. Both systems are available in 500mm x 1m size panels and arrive on site with preformed omega-shaped channels in place. The 16mm-diameter, multi-layer metal/polyethylene PE-RT pipe is then clipped into the channels. The Screed Replacement Tiles are laid on top and bonded together. They are not bonded to the underfloor heating system, so as to create a floating floor. The chosen final floor finish, whether marble or granite, is then laid.

Jupiter claims its system is around 14% more efficient than a screed underfloor heating system. A comparison test showed the dry-installed system operated similarly to a radiator, with the floor heating up and cooling down quickly, while the screed heating system had a much slower response time. The Jupiter heating system costs around £38 per sq m.

2ND MARCH 2010

THE FUTURE OF THE MODERN CITY

 PROF. GLENN EVANS

 WAYNE HEMMINGS

This symposium brings together leading thinkers and experts of change in the built environment and covers the following key themes:

- Places
- Innovation in investment and sustainability
- Regeneration and living
- Buildings and design
- Transport
- World city exemplar
- The city at night

Our panel will draw on their own experience and their individual thinking to discuss how cities can shape themselves for the future. So, if you want to hear what they have to say – you can't afford to miss this event at a recession-busting price of £75. To find out more and to book your place visit the event website below.

 Coventry City Council

Platform Lifts - accessibility solutions

Gartec offer a comprehensive range of lifts to suit today's building demands, with a maximum travel of 12 metres for domestic and commercial applications.

Virtually no building work required - installation takes just 2 days

Choose from a range of finishes and optional extras

Enables building designers to meet Part M, BS 8300 requirements and obligations under the DDA

Hassle-free project management from the UK's leading platform lift supplier

Compliant with EN81-41 Platform Lift European Standard

GARTEC

LEADING THE PLATFORM LIFT INDUSTRY
